

Customers of CAMO fasteners,

CAMO 316/A4 stainless steel Edge Fasteners are currently being sold in two forms. One is bright (no coating) and one is still in the original form which has an additional black coating. The purpose of the black coating originally was only to help eliminate the possibility of glare in the sunlight and minimize the visibility of the screw head from the deck top. Over the coming months we'll be eliminating the use of the black coating altogether as we have already with some of our newer manufacturing partners.

The black coating has nothing to do with physical performance or corrosion resistance and our 316/A2 screw will perform exactly the same in regards to those aspects.

In the coming months you may receive the 316/A4 screws in either of the styles but rest assured that they are equal in quality and performance.

Thank you,

A handwritten signature in black ink, appearing to read 'Jim Winn', with a long horizontal flourish extending to the right.
